

FUNCTION MEETS COMFORT

Active Bedding for a Restful Sleep

Like your favorite activewear, Suprelle® Active wicks moisture, helping to keep your sleep environment dry and fresh throughout the night.

Suprelle® Active features a mix of innovative fibers, among them a special cross-section that allows for transportation of perspiration away from the body to the surface where it can swiftly evaporate.

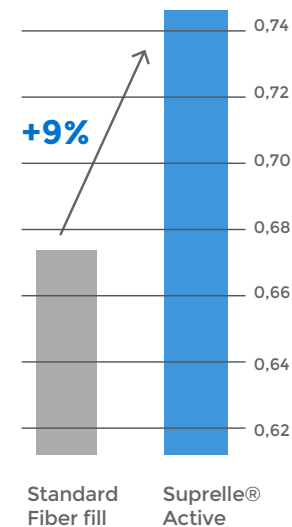

*Suprelle® Active
balances differences in temperature
and its enlarged surface transports
moisture away from the body.*

Warmth is perceived differently during the various phases of sleep. The functional fiber mix helps balance differences in temperature and its enlarged surface aids in transporting any moisture away from the body. This interaction helps maintain the body in a comfort zone, for restful sleep all night long.

*Independent testing shows that
Suprelle® Active has better
moisture transport than
traditional fiber fill.*

The water vapour permeability index was tested in order to evaluate the physiological comfort of duvets featuring functional filling fibers*. This considers insulation and resistance to water vapour permeability - regardless of the thickness of the material. It therefore provides an indication of the relative moisture transport characteristics. The higher the water vapour permeability index (imt), the better the physiological quality of the material is.

* Test conducted (Summer 2014)
by TÜV Rheinland as per
EN 31092/ISO 11092:1993
