

BREATHABLE SUPPORT

Proven Pressure Distribution and Breathability

Like memory foam, Suprelle® Memory was designed to be dense and supportive, cradling the head and neck to help reduce muscular tension for optimal cervical support.

Suprelle® Memory is a micro-fiber fill made of a new modified polymer which provides the pillow with viscoelastic effect. This patent-pending technology permits pillows to mold to the shape of the head and contours of the neck to provide outstanding support.

Excellent humidity absorption

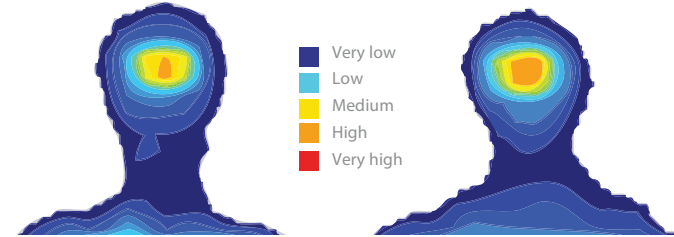

Compared to memory foam, Suprelle® Memory provides better heat distribution and improved air circulation to help prevent a build up of humidity and heat, creating a pleasant micro-climate.

Thermography tests* show that body heat has nearly completely dissipated after just 2 minutes. After 5 minutes Suprelle® Memory completely eliminates all residual heat, thus offering a more balanced sleep temperature.

Better pressure distribution

Suprelle® Memory

Visco PU block
(Memory foam)

Suprelle® Memory delivers better peak pressure distribution, with lower peak pressure points, than a visco PU block. Improves breathability and reduces heat build up in pillows.

Tests performed in independent test laboratory in Germany (Kiel)
